- (a) Both A and R are true and R is the correct explanation of A.
- (b) Both A and R are true but R is not the correct explanation of A.
- (c) A is true but R is false.
- (d) A is false but R is true.

Q.5. **Assertion(A)** : A ray of light travelling from a rarer medium to a denser medium slows down and bends away from the normal. When it travels from a denser medium to a rarer medium, it speeds up and bends towards the normal.

**Reason (R)** : The speed of light is higher in a rarer medium than a denser medium.

Q.6. **Assertion(A)**: The mirrors used in search lights are concave spherical.

**Reason (R)** : A convex mirror has much larger field of view than a plane mirror.

Q.9. **Assertion(A)** : The height of an object is always considered positive.

**Reason (R)** : An object is always placed above the principal axis in this upward direction.

## MULTIPLE CHOICE QUESTIONS

Q10. Image formed by a convex spherical mirror is:

- (a) virtual
- (b) real
- (c) enlarged
- (d) inverted

Q11 A student studies that a convex lens always forms a virtual image irrespective of its position. What causes the convex mirror to always form a virtual image?

- (a) Because the reflected ray never intersects
- (b) Because the reflected ray converges at a single point
- (c) Because the incident ray traces its path back along the principal axis
- (d) Because the incident ray of a convex mirror gets absorbed in the mirror

Q12) Magnification produced by a rearview mirror fitted in vehicles:

- (a) is less than one
- (b) is more than one
- (c) is equal to one
- (d) can be more than or less than one, depending upon the position of the object in front of it

Q13) Which of the following can make a parallel beam of light from a point source incident on it?

- (b) Convex mirror as well as concave lens
- (c) Two plane mirrors placed at 90 degree to each other
- (d) Concave mirror as well as concave lens

Q14) A student studies that the speed of light in air is 300000 km/sec, whereas that of speed in a glass slab is about 197000 km/sec. What causes the difference in the speed of light in these two media?

- (a) Difference in density
- (b) Difference in temperature
- (c) Difference in the amount of light
- (d) Difference in the direction of wind flow

## CASE BASED STUDY

Read the following and answer any four questions from (i) to (v).

The spherical mirror forms different types of images when the object is placed at different locations. When the image is formed on screen, the image is real and when the image does not form on screen, the image is virtual. When the two reflected rays meet actually, the image is real and when they appear to meet, the image is virtual.

A concave mirror always forms a real and inverted image for different positions of the object. But if the object is placed between the focus and pole, the image formed is virtual and erect.

A convex mirror always forms a virtual, erect and diminished image. A concave mirror is used as doctor's head mirror to focus light on body parts like eyes, ears, nose etc., to be examined because it can form erect and magnified image of the object. The convex mirror is used as a rear view mirrors in automobiles because it can form an small and erect image of an object.

**(i) When an object is placed at the centre of curvature of a concave mirror, the image formed is**

- (a) larger than the object                      (b) smaller than the object  
(c) same size as that of the object              (d) highly enlarged.

**(ii) No matter how far you stand from a mirror, your image appears erect. The mirror is likely to be**

- (a) plane                      (b) concave                      (c) convex                      (d) either plane or convex.

**(iii) A child is standing in front of a magic mirror. She finds the image of her head bigger, the middle portion of her body of the same size and that of the legs smaller. The following is the order of combinations for the magic mirror from the top.**

- (a) Plane, convex and concave                      (b) Convex, concave and plane  
(c) Concave, plane and convex                      (d) Convex, plane and concave

**(iv) To get an image larger than the object, one can use**

- (a) convex mirror but not a concave mirror  
(b) a concave mirror but not a convex mirror  
(c) either a convex mirror or a concave mirror  
(d) a plane mirror.

**(v) A convex mirror has wider field of view because**

- (a) the image formed is much smaller than the object and large number of images can be seen.  
(b) the image formed is much closer to the mirror  
(c) both (a) and (b)  
(d) none of these.
